

Week 2 – Process & Project

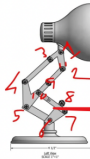

Final system integration, firmware development, **debugging and optimization**, mechanical assembly, **circuit validation**, power regulation and distribution testing, calibration of **sensors** and actuators, real-time communication refinement (**WebSocket**), and **performance testing**.

Final Model before Exhibit Week.

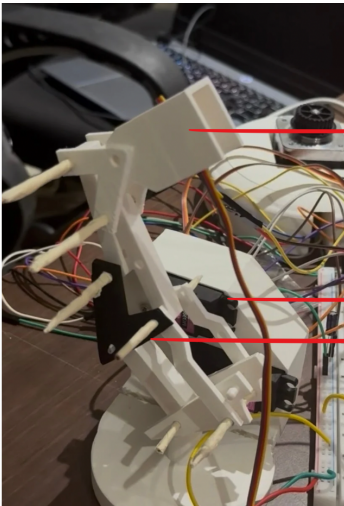

Fixing it up

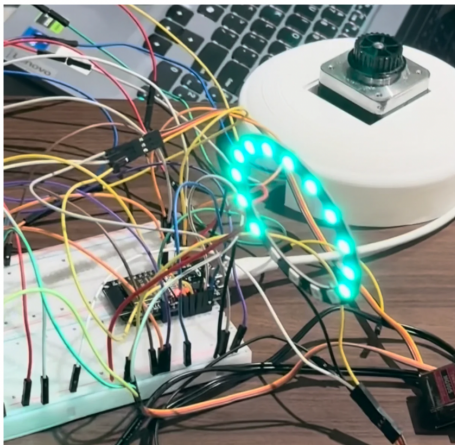

Planning out servo motors and placement

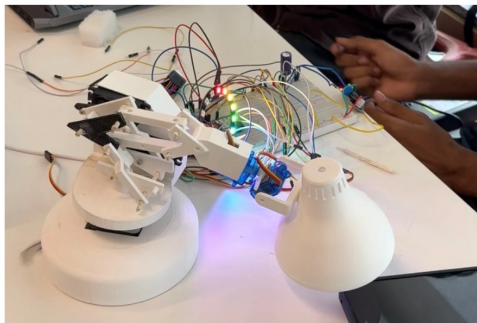

3d printed structure assembly--figuring out how to mount the head and fix the joints to be decently flexible.

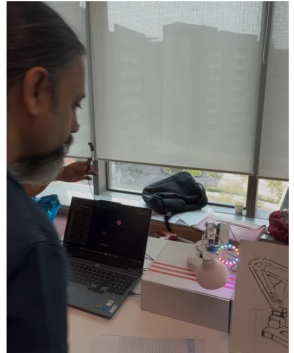

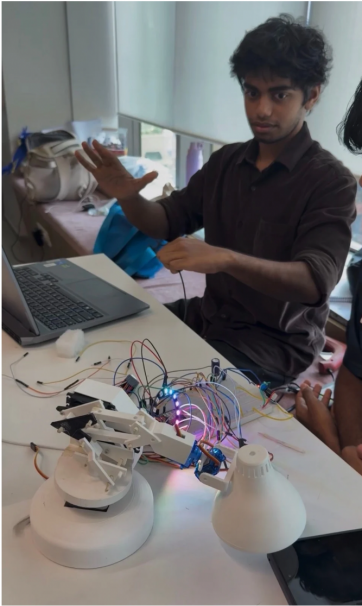

Pain Point and Redos:
Servo fixation, working the code, toothpicks as joints and **structure stability**.

Emotion Parser, and integrating this neopixel into the Luxo Lamp.

Hand Tracking

Ensuring before submission that the Gemini AI model responds right and within a limited time frame.
